

Career Copilot Premium

macOS Install Guide

Version 1.0.7

1. Download & Mount the App

You'll receive `CareerCopilotPremium-mac.dmg`. This is a standard macOS disk image containing the Career Copilot Premium app.

- 1 Double-click `CareerCopilotPremium-mac.dmg` to mount it.
- 2 A Finder window opens showing the **Career Copilot Premium** app icon next to an **Applications** shortcut.
- 3 Drag **Career Copilot Premium** onto the **Applications** shortcut to install it.
- 4 Eject the disk image once the copy finishes.

2. First Launch (macOS Gatekeeper)

Career Copilot Premium is not yet notarized by Apple, so macOS will warn that the app is from an "unidentified developer" the first time you open it. This is expected — do the following once:

- 1 Open **Applications** in Finder.
- 2 **Right-click** (or Control-click) **Career Copilot Premium** and choose **Open**.
- 3 Click **Open** again in the confirmation dialog.

If macOS still blocks it: go to **System Settings** → **Privacy & Security**, scroll to the Security section, and click **Open Anyway** next to the Career Copilot Premium message.

After this first approval, the app opens normally with a regular double-click going forward.

3. Activate on This Mac

Career Copilot Premium uses offline, machine-bound activation — no internet connection is required to activate, and your license is tied to this specific Mac.

1. On first launch, the app shows a **Request Code** unique to this Mac.
2. Send that request code to whoever provided your license.
3. Enter the **Activation Code** you receive back into the app.

Activation is stored locally and persists across restarts and reboots — you will not need to re-activate each time you open the app.

4. Set Up Call Audio Capture (BlackHole)

Your Mac's built-in microphone is enough to capture *your own* voice. To also capture the **interviewer's** audio from Zoom, Google Meet, or similar apps, install BlackHole — a free virtual audio driver:

1. Open **Terminal**.
2. Install Homebrew if you don't already have it:

```
/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"
```
3. Install BlackHole:

```
brew install blackhole-2ch
```
4. Open **Audio MIDI Setup** (Spotlight search) and create a **Multi-Output Device** combining your speakers and BlackHole, so you can still hear the call while it's captured.
5. In your meeting app (Zoom/Meet), set the audio output to the Multi-Output Device.

This step is optional. The app works fine with microphone-only capture — BlackHole is only needed if you want the interviewer's side of the call transcribed automatically.

Career Copilot Premium detects BlackHole automatically once it's installed and routed, and will label it "Speaker Capture (BlackHole)" in System Status.

5. Grant Microphone Permission

The first time Career Copilot Premium tries to record, macOS will ask for microphone permission.

1. Click **Allow** when prompted.
2. If you missed the prompt, go to **System Settings** → **Privacy & Security** → **Microphone** and enable it for Career Copilot Premium.

6. Complete the Setup Wizard

On first launch the app walks you through a short setup wizard. You only need to complete this once — your answers are saved to your profile and pre-filled the next time you open the app.

- 1 Enter your name and paste in your resume text (or upload a resume PDF).
 - 2 Add your Mistral API key — get a free key at console.mistral.ai — and confirm your audio device.
 - 3 Setup completes and the dashboard opens.
-

7. Using the App

Link your phone (optional)

Mirror live AI answers on your phone screen during the interview — useful if your laptop screen is shared with the interviewer.

1. Open the sidebar and click **Link Device**.
2. Scan the QR code with your phone camera, or type the 6-digit code shown below it.
3. Your phone opens straight to the live answer page in its browser — no app install required.

During a live interview

Press **F2** to start listening for the interviewer's question, and **F3** to hide or show the overlay at any time.

8. Troubleshooting

App won't open / "unidentified developer": see Step 2 above (right-click → Open, or allow it in Privacy & Security settings).

No microphone detected: check **System Settings** → **Privacy & Security** → **Microphone**, and confirm an input device is selected in **System Settings** → **Sound**.

Can't hear interviewer's audio in transcript: confirm BlackHole is installed and your meeting app's audio output is routed through the Multi-Output Device (Step 4).

Ollama warning in System Status: Ollama is optional. Career Copilot Premium uses the Mistral API by default — only install Ollama if you want a local, offline AI fallback.

Activation code rejected: make sure the request code you sent matches exactly what's shown in the app on this Mac — activation codes are generated per-machine.
